FOR IMMEDIATE RELEASE

STONEWARE, INC. Announces iPhone personality for webOS - Web Desktop Virtualization™

Indianapolis, IN – July, 2008 – Stoneware, Inc. today announced it will deliver a new webOS virtual desktop for the Apple iPhone 3G in its next product update of webOS. An integrated webOS personality will give organizations a means of providing mobile workers with secure access to their enterprise applications and data, all from their iPhone.

Stoneware's revolutionary virtual desktop approach makes it possible to adapt virtual desktops for a rapidly growing mobile device market. The "decoupling" of the desktop user interface from the operating system makes it possible to deliver applications and services to a growing mobile workforce armed with Smartphones such as the Apple iPhone 3G.

"The iPhone goes well beyond the personal digital assistant we knew a few years back", says Ken Quinton, VP Sales, Stoneware, Inc. "Consider the iPhone 3G as the first truly unique entry into the thin client market. With AT&T 3G connectivity, Stoneware can enable the iPhone to access corporate information and applications through a virtual web desktop that was once limited to desktops and laptops."

Stoneware's virtual web desktop for the Apple iPhone 3G will be released in webOS version 5.4, due in October. For more information please go to www.stonewarewebos.com or call 888.473.9485.
